In 1892 Ernest Von Rebeur-Paschwitz observed for the first time at Strasbourg the periodic oscillations of the vertical due to the Earth tides using a Repsold horizontal pendulum installed from April 1892 to September 1893

But it was only in 1954 that Professor Robert Lecolazet initiated continuous Earth Tide observations in Strasbourg using different gravimeters

Hence Strasbourg became the first permanent gravimetric station for Earth tides in the world (cf. IAG publication in July 1959)

We focus on the observational period with gravimeters

1954 - 2014

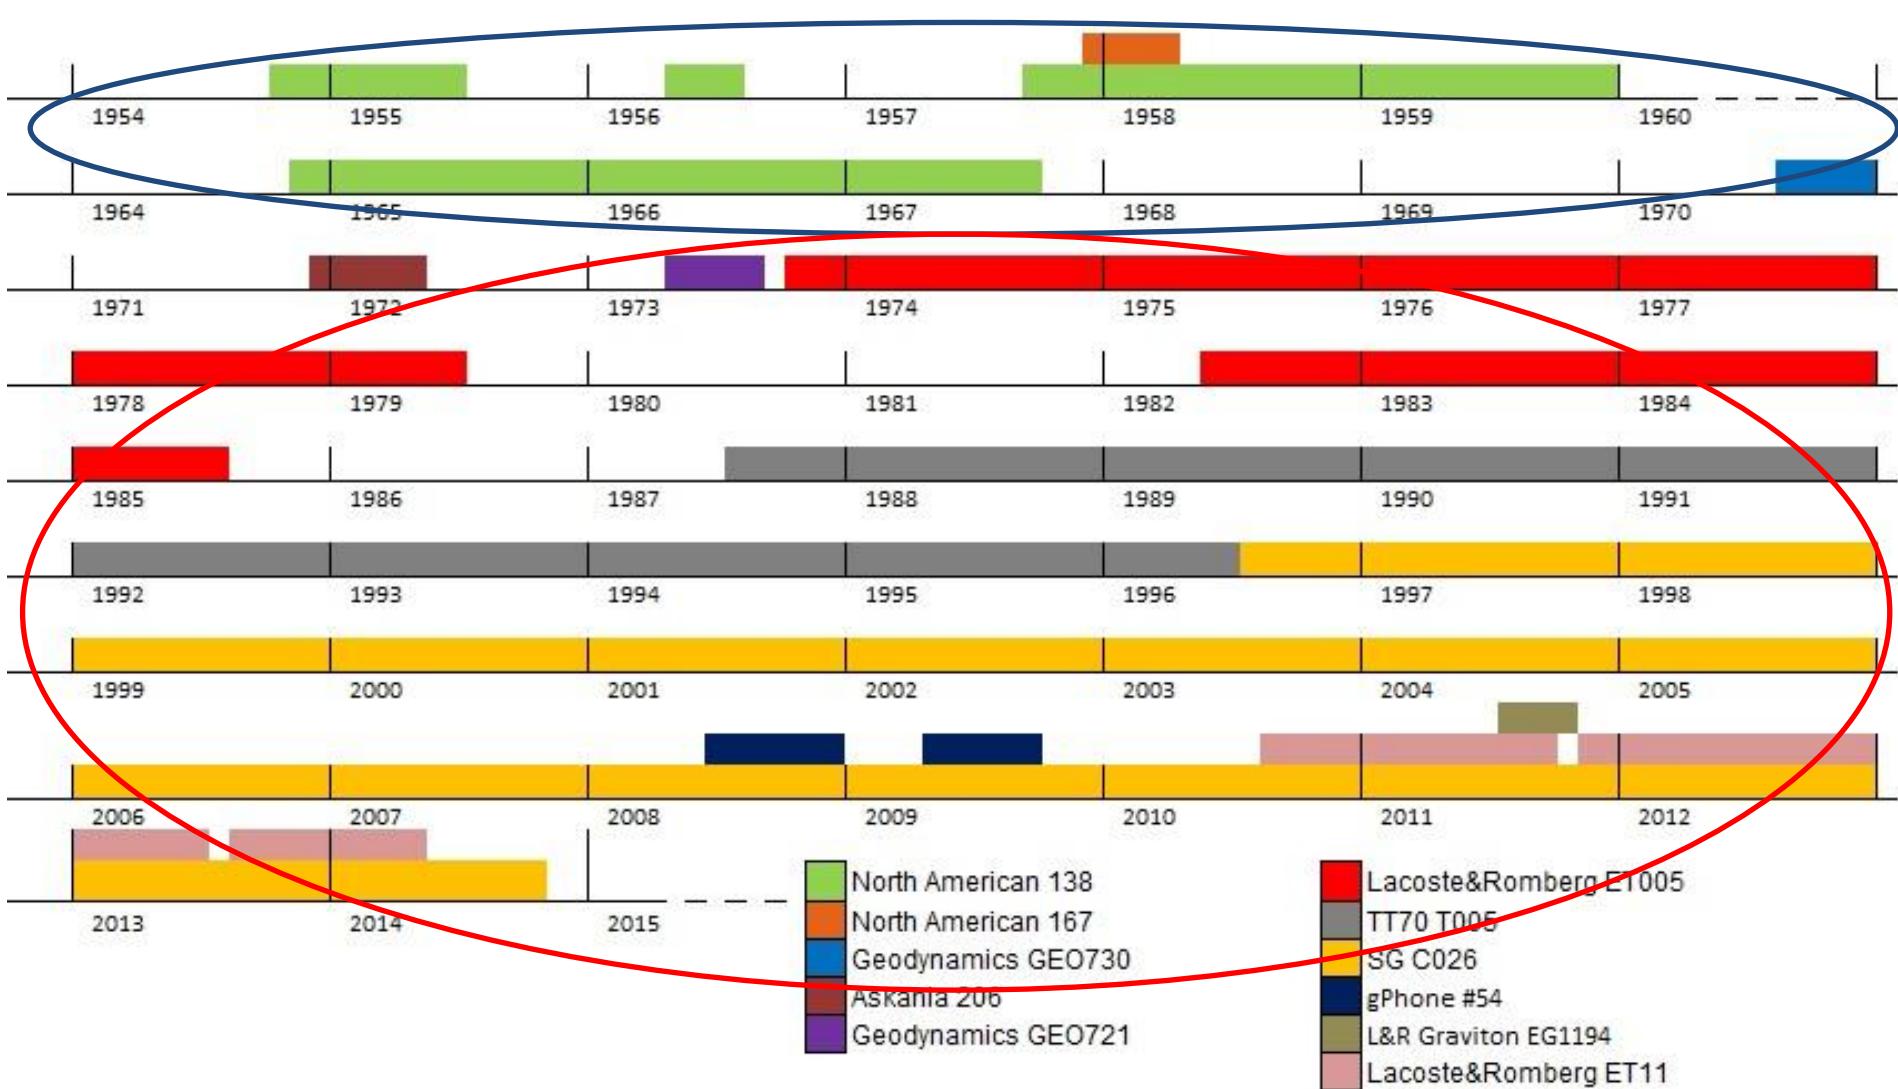

9th Earth Tide Symposium
New York, 1981

Prof. Robert Lecolazet (1910-1990)

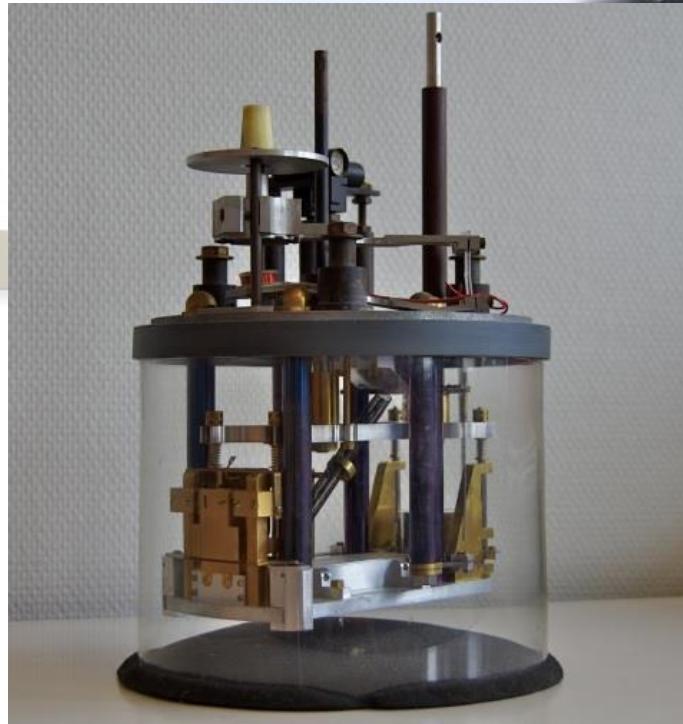

- ✓ Worked at 'Institut de Physique du Globe de Strasbourg (IPGS)' since 1937
- ✓ Focusing his work into the gravity field (especially devoted to the study of Earth Tides) from 1954
- ✓ 1962 -1979 President of 'Permanent Commission on Earth Tides'

Superconducting gravimeters

*Mise en évidence d'ondes de marée quart-diurnes de quelques pico-g d'amplitude
à l'aide de gravimètres supraconducteurs*
Florsch, Hinderer, Legros, 1995

Superconducting gravimeters

Since **1987**, two different superconducting gravimeters have been recording in two consecutive periods

The first SG was a TT70 model from GWR Instruments installed in July 1987. This meter was recording for almost 10 years

In **July 1996**, it was replaced by a more compact model, the SG C026, which is still recording

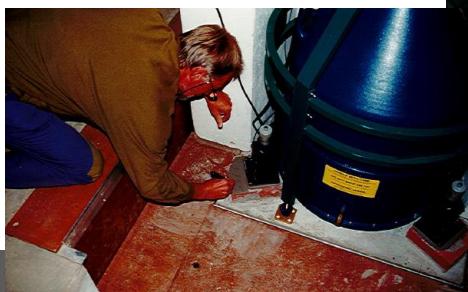

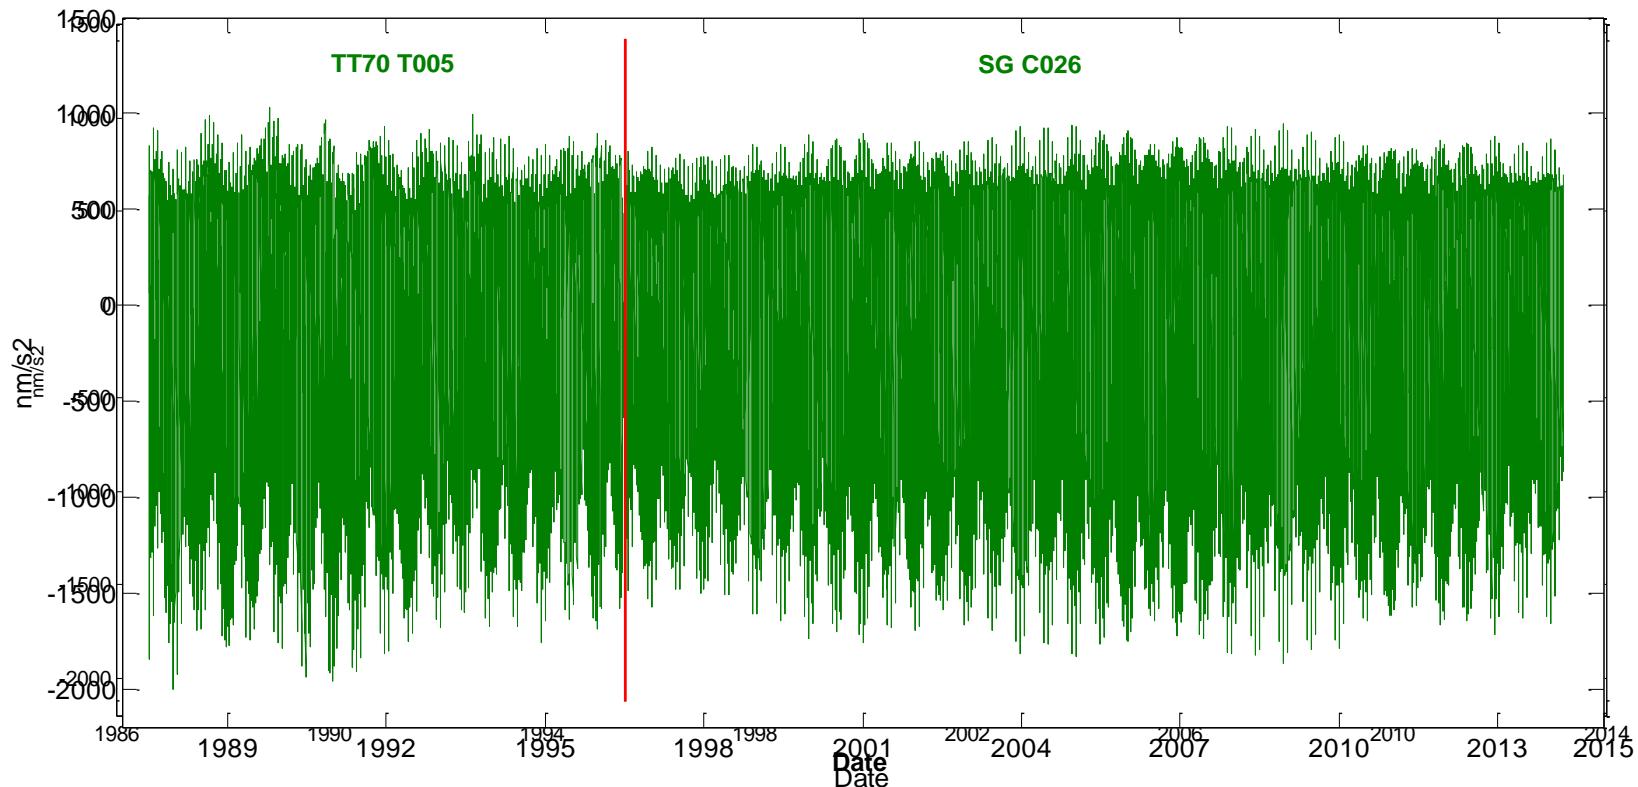

Superconducting gravimeter

Since **1987**, two different superconducting gravimeters have been recording in two consecutive periods.

The first SG was installed in July 1987. This meter was recorded until July 1996.

In July 1996, it was replaced by a new SG which is still recording.

T005 99+70 days C026

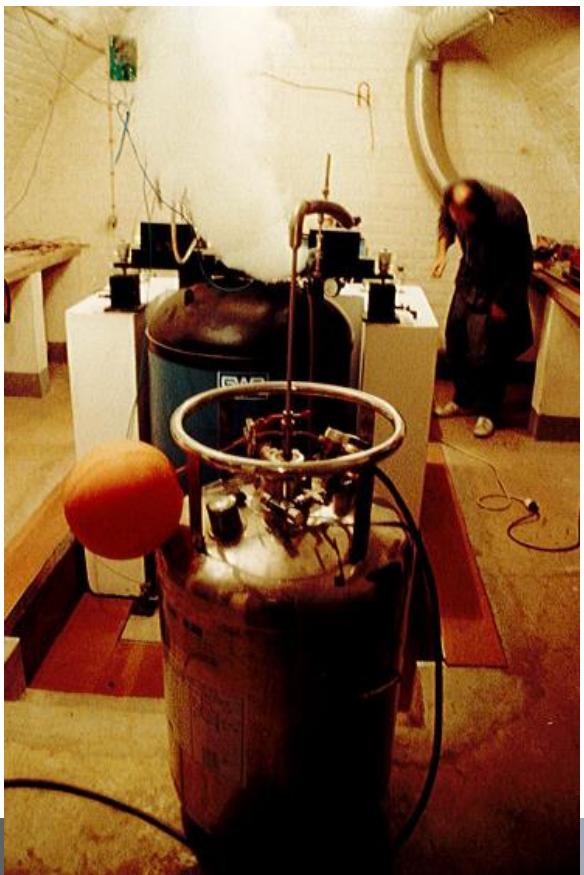

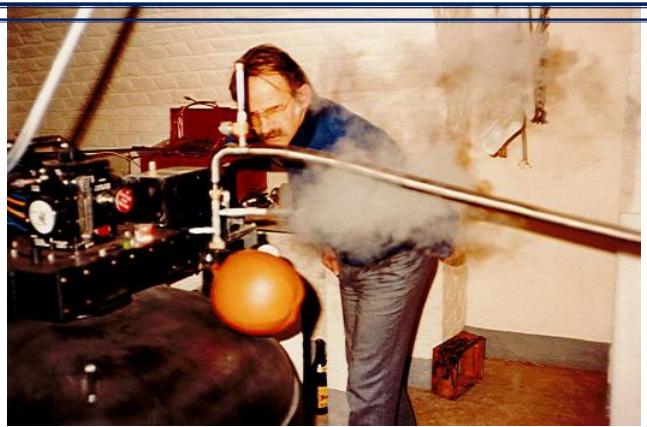

Both SGs have been installed on the same pillar

There were only few days between the removal of the T005 and the installation of the C026 (11 days compared to 27 years, almost negligible)

Absolute gravimeters

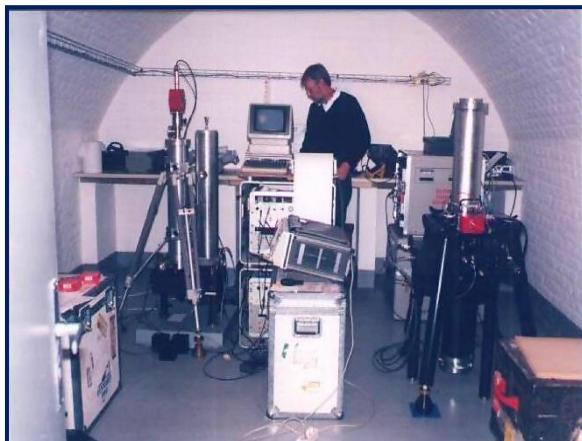

Since **1997**, there is also a portable absolute gravimeter FG5 # 206 manufactured by Micro-g Solutions which is regularly measuring at the J9 Observatory in parallel with the SG

Absolute gravimeters

Absolute gravimeters

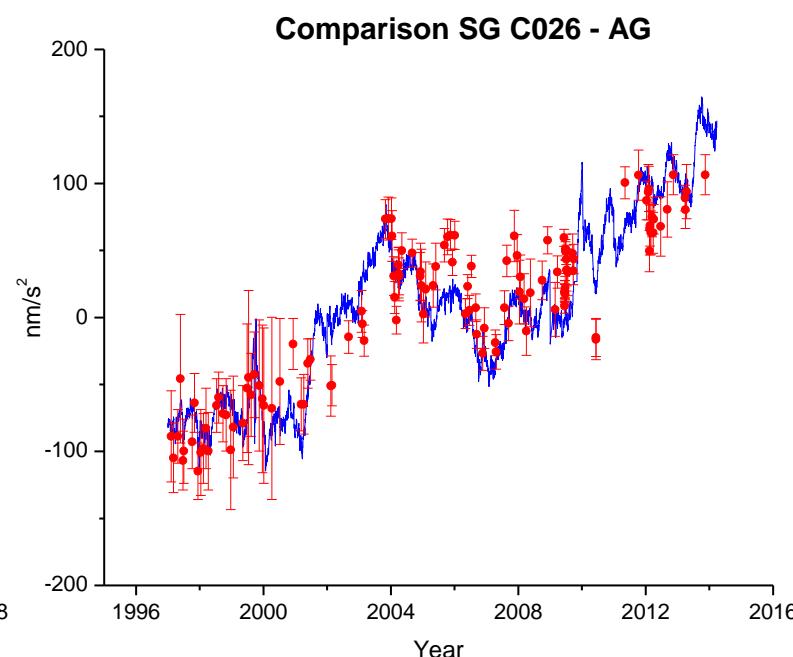

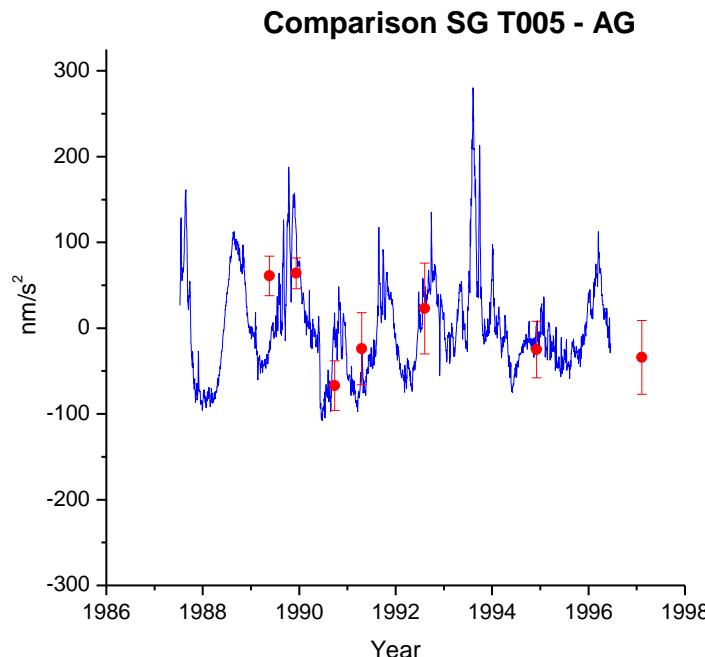

Since **1997**, there is also a portable absolute gravimeter FG5 # 206 manufactured by Micro-g Solutions which is regularly measuring at the J9 Observatory in parallel with the SG

Some other absolute gravimeters have measured at the station, as the JILAgr or the A10 models

The main purposes of these AG measurements performed at J9 are the drift control and the calibration of the superconducting gravimeters (T005 and C026)

Drift control

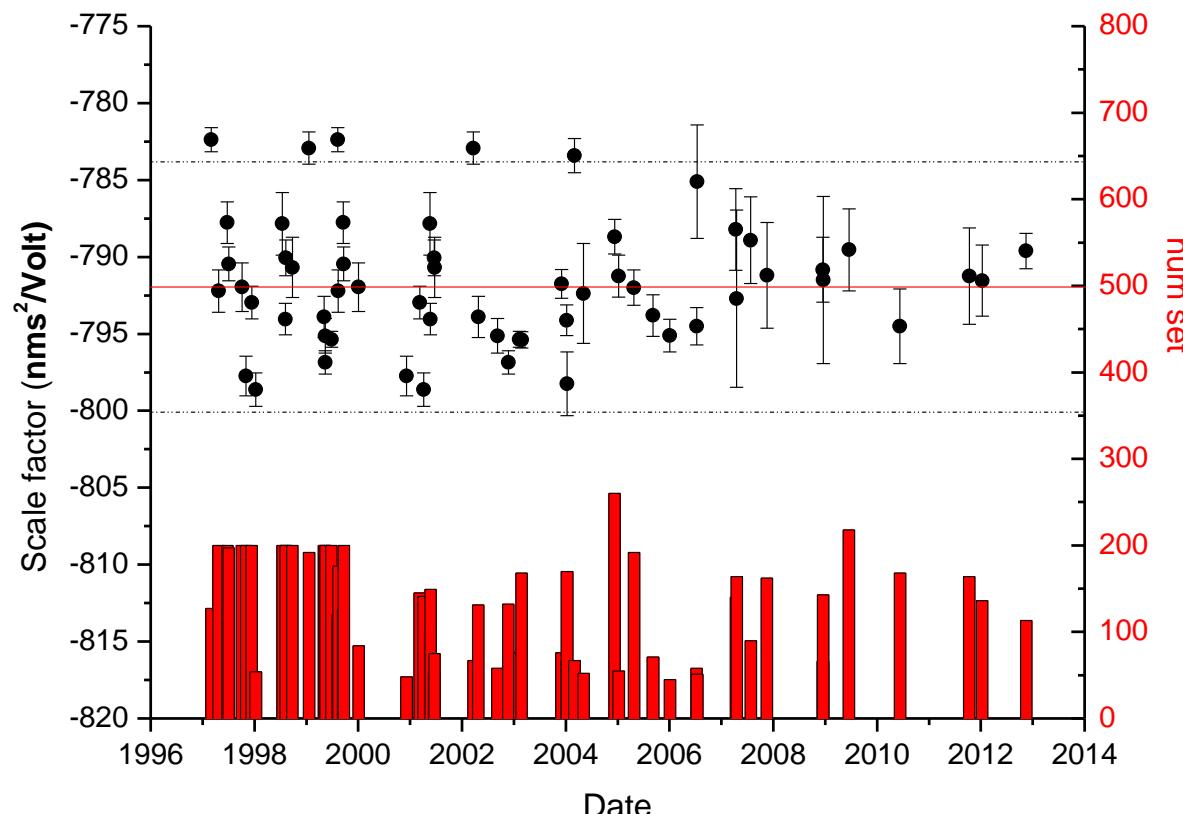

Superposition of SG gravity residuals (continuous line) with AG measurements (dots with error bars) (left) between SG (T005) and AG (JILA-5) for the period 1987–1996, (right) between SG (C026) and AG (FG5#206) data for the period 1996–2014

Amalvict et al., 1999

SG calibration

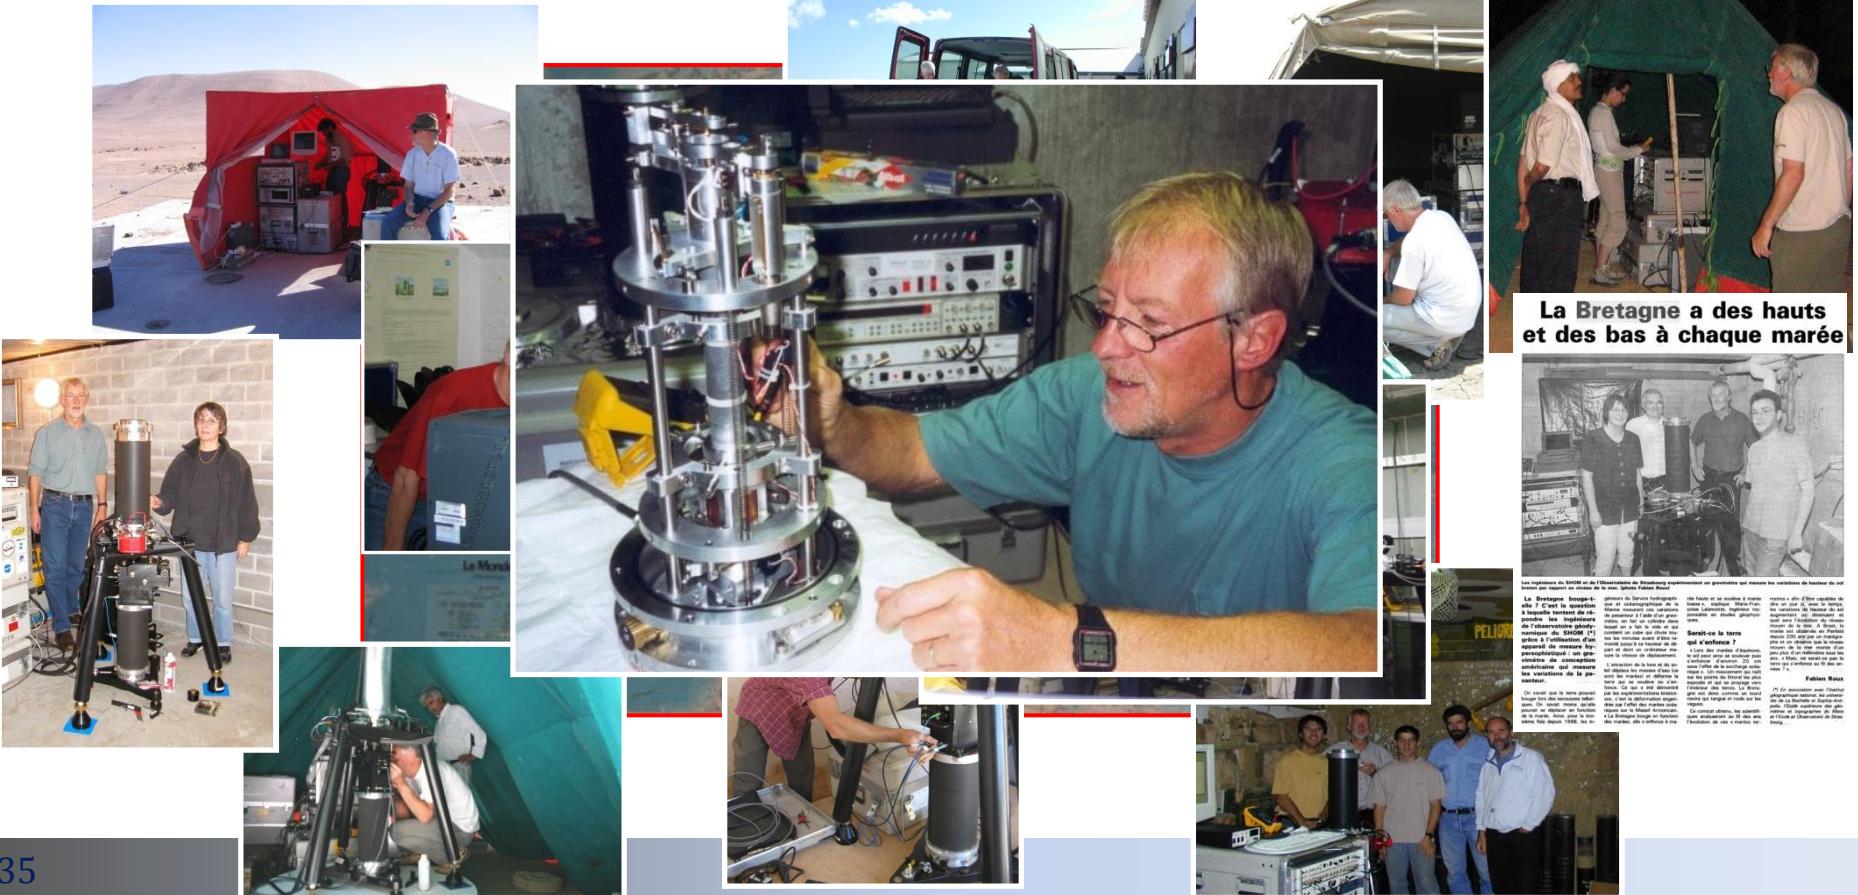

Calibration experiments of different durations (from 2 to 10 consecutive days)
carried out by co-located AG measurements since 1997 to 2014

Calvo et al. 2014

Absolute gravimeter FG5#206

This gravimeter has also been involved in several field missions in France and all around the world.

What's coming next?

The SG C026, will be replaced in a near future by a more compact observatory model iOOG

What's coming next?

THANK YOU!

FOR ANOTHER 60 YEARS!

We especially express our thanks to people involved at various levels in the Strasbourg gravimetric Observatory including (for the SG period):

J. Bonnin, Y. Legros, N. Florsch, P. Gegout, M. Greff-Lefftz, D. Crossley, O. Jensen, D. Smylie, U. Riccardi, O. Francis, M. Van Camp, B. Ducarme, W. Zürn, H. Wilmes, J. Mäkinen, V. Pálinkás, etc...

Thank you: C.Heimlich for pictures & F. Littel for video
